

## PH3110 Vector Exercises

You should be able to do these without a calculator (except for inverse trig functions and possibly a square root) or reference book.

1. For vectors  $\mathbf{A} = 2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k}$  and  $\mathbf{B} = 2\mathbf{i} - 4\mathbf{j} + 3\mathbf{k}$  compute:

(A)  $\mathbf{A} + \mathbf{B}$

(B)  $\mathbf{A} - \mathbf{B}$

(C)  $\mathbf{A} \cdot \mathbf{B}$

(D)  $\mathbf{A} \times \mathbf{B}$

(E) the angle between  $\mathbf{A}$  and  $\mathbf{B}$

(F) the components of  $\mathbf{A}$  in spherical coordinates.

(G) the angle between  $\mathbf{B}$  and the y axis.

(H) for the tensor  $\mathbf{D}$  shown, compute  $\mathbf{A} \cdot \mathbf{D} \cdot \mathbf{B}$ .

(I) compute  $\mathbf{D}^T \mathbf{D}$ .

$$\mathbf{D} = \frac{1}{5} \begin{pmatrix} 3 & 4 & 0 \\ -4 & 3 & 0 \\ 0 & 0 & 5 \end{pmatrix}$$

2. Suppose a tensor  $\mathbf{R}$  corresponds to a rotation in three dimensions. With  $\mathbf{C}$  any vector (in three dimensions), use a geometric argument to explain why the following will be true.

$$(\mathbf{R}\mathbf{C}) \cdot (\mathbf{R}\mathbf{C}) = \mathbf{C} \cdot \mathbf{C}$$

3. Show that for any three vectors,  $\mathbf{A}$ ,  $\mathbf{B}$ , and  $\mathbf{C}$ , that

$$(A) \quad \mathbf{A} \times (\mathbf{B} \times \mathbf{C}) = (\mathbf{C} \times \mathbf{B}) \times \mathbf{A} = (\mathbf{A} \cdot \mathbf{C})\mathbf{B} - (\mathbf{A} \cdot \mathbf{B})\mathbf{C}$$

(See if you can do part A more elegantly than by simply writing out components and applying brute force)

$$(B) \quad \mathbf{A} \times (\mathbf{B} \times \mathbf{C}) + \mathbf{B} \times (\mathbf{C} \times \mathbf{A}) + \mathbf{C} \times (\mathbf{A} \times \mathbf{B}) = \mathbf{0}$$

(Hint: instead of writing out components, try using the identities in part A for part B)
